

Upgrading to advanced editions of Acronis Backup & Recovery 11.5

Update 1

Applies to the following editions:

- Advanced Server
- Virtual Edition
- Advanced Server SBS Edition
- Advanced Workstation
- Server for Linux
- Server for Windows
- Workstation

1 Introduction

The present guide describes the upgrade from advanced editions of Acronis Backup & Recovery 10 and Acronis Backup & Recovery 11 to advanced editions of Acronis Backup & Recovery 11.5. It also describes the upgrade from Acronis Recovery from Microsoft Exchange to Acronis Backup & Recovery 11.5 for Microsoft Exchange Server.

2 Overview

2.1 Upgrade from Acronis Backup & Recovery 10

Out of Acronis Backup & Recovery 10 components, only agents can interact with components of Acronis Backup & Recovery 11.5. Hence, you first need to upgrade the management console, license server, management server, and storage nodes. Acronis Backup & Recovery 10 agents can continue backing up to the existing vaults.

After that, upgrade some or all of the Acronis Backup & Recovery 10 agents. For example, you can upgrade agents on a single machine or on a few machines to test the new product, while the remaining machines are protected by Acronis Backup & Recovery 10. Then, upgrade the majority of the Acronis Backup & Recovery 10 agents and apply the proven technology to them.

All agents that back up to tape devices attached to a storage node must be upgraded along with the storage node.

2.1.1 Using old agents in the new environment

General

Be sure to use version of Acronis Backup & Recovery 10 agent not earlier than Update 2 (build 11639).

New console

Acronis Backup & Recovery 11.5 console displays Acronis Backup & Recovery 11.5 Help even if connected to an Acronis Backup & Recovery 10 agent. It means that descriptions in the context help may differ from the appearance of the product windows and that the help may describe features which are not present in the product.

New management server

When creating a centralized backup plan, you cannot directly select data on a machine with an Acronis Backup & Recovery 10 agent. Use selection rules as you did when creating a backup policy in Acronis Backup & Recovery 10.

When you run or stop a centralized backup plan manually, only Acronis Backup & Recovery 11.5 agents carry out the action. Acronis Backup & Recovery 10 agents do not respond.

New storage node

After upgrading the storage node, its managed vaults (except for those located on tapes) automatically become backward compatible. It means that both Acronis Backup & Recovery 10 agents and Acronis Backup & Recovery 11.5 agents can back up to the vaults.

Should you need to create a new managed vault and set up Acronis Backup & Recovery 10 agents to back up to it, enable the backward compatibility option when creating the vault.

Remember that you cannot define **Vault administrators** and **Vault users** for backward compatible vaults. This functionality is exclusive for Acronis Backup & Recovery 11.5. You cannot convert a backward compatible vault to an ordinary managed vault either.

Managed vaults located on tapes are not backward compatible. You need to upgrade all the agents that back up to such vaults.

How different software versions work in a backward compatible managed vault

- Acronis Backup & Recovery 10 agents and Acronis Backup & Recovery 11.5 agents write the data to such vaults in their respective formats.
- Acronis Backup & Recovery 10 agents have access only to their backups while Acronis Backup & Recovery 11.5 agents can access any backup.
- In a deduplicating vault, the backups written by Acronis Backup & Recovery 10 agents are not deduplicated with the backups written by Acronis Backup & Recovery 11.5 agents and vice versa. Each product has its own deduplication datastore.

2.1.2 What happens with backup policies and plans

After the upgrade, all backup plans, recovery tasks and validation tasks will be preserved. Backup policies will be converted to centralized backup plans.

Centralized backup plans that reside on a management server provide all the functionality previously provided by backup policies. If you edit such a plan, the changes will be deployed to all machines included in the plan. To "apply" such a plan to a machine or a group or to "revoke" it, just edit the plan to add or remove the machine or the group. In addition to using selection rules, you can directly select data to back up on each machine. However, both methods of selection cannot be used within one backup plan.

2.1.3 Backup to tapes

Unlike Acronis Backup & Recovery 10, Acronis Backup & Recovery 11.5 does not use Windows Removable Storage Manager (RSM). During an upgrade from Acronis Backup & Recovery 10, Acronis Backup & Recovery 11.5 writes the necessary information from RSM to its own database in the new format.

This means that Acronis Backup & Recovery 11.5 can back up to tapes even if the Windows version installed on the machine does not support RSM.

2.2 Upgrade from Acronis Backup & Recovery 11

Using old agents in the new environment

Out of Acronis Backup & Recovery 11 components, only agents can interact with components of Acronis Backup & Recovery 11.5. Hence, you first need to upgrade the management console, license server, management server, and storage nodes. Acronis Backup & Recovery 11 agents can continue backing up to the existing vaults.

After that, upgrade some or all of the Acronis Backup & Recovery 11 agents. For example, you can upgrade agents on a single machine or on a few machines to test the new product, while the remaining machines are protected by Acronis Backup & Recovery 11. Then, upgrade the majority of the Acronis Backup & Recovery 11 agents and apply the proven technology to them.

New console

Acronis Backup & Recovery 11.5 console displays Acronis Backup & Recovery 11.5 Help even if connected to an Acronis Backup & Recovery 11 agent. It means that descriptions in the context help may differ from the appearance of the product windows and that the help may describe features which are not present in the product.

New management server

Acronis Backup & Recovery 11.5 management server works with Acronis Backup & Recovery 11 agents without limitations.

New storage node

Acronis Backup & Recovery 11.5 storage node works with Acronis Backup & Recovery 11 agents without limitations. It means that after upgrading the storage node, both Acronis Backup & Recovery 11 agents and Acronis Backup & Recovery 11.5 agents can back up to its managed vaults.

What happens with backup plans and tasks

After the upgrade, all centralized and local backup plans, recovery tasks, and validation tasks will be preserved.

3 Before the upgrade

Update or upgrade Acronis Backup & Recovery 10 if necessary

If Acronis Backup & Recovery 10 version is earlier than Update 2 (build 11639)

You need to update Acronis Backup & Recovery 10 to the latest version before upgrading it to Acronis Backup & Recovery 11.5. Otherwise, the setup program will remove Acronis Backup & Recovery 10 and will install Acronis Backup & Recovery 11.5 anew. Hence, you will lose all your logs, tasks, vaults and configuration settings.

If Acronis Backup & Recovery 10 is installed on a Linux machine

This relates to a Linux machine on which Acronis Backup & Recovery 10 Agent for Linux or Management Console is installed.

You can upgrade Acronis Backup & Recovery 10 components directly to Backup & Recovery 11.5. In this case, the setup program will remove Acronis Backup & Recovery 10 and will install Acronis Backup & Recovery 11.5 anew. Hence, you will lose your logs, tasks, personal vaults, and configuration settings that are stored on the machine. You will need to re-create tasks and vaults and to configure the software again. However, the backups will remain intact.

If you want to keep your configuration, upgrade Acronis Backup & Recovery 10 to Acronis Backup & Recovery 11 before upgrading it to Acronis Backup & Recovery 11.5. In this case, you will need a pair of an upgrade license key for Acronis Backup & Recovery 11 and a full license key for Acronis Backup & Recovery 10 per machine on which you want to upgrade the agent. For more details about upgrading to Acronis Backup & Recovery 11, see the "Upgrading to advanced editions of Acronis Backup & Recovery 11" document.

Obtain the license keys

Prior to the upgrade, make sure that you have the appropriate number of license keys for Acronis Backup & Recovery 11.5. You can use the following license keys:

- An upgrade license key for Acronis Backup & Recovery 11.5 + a license key for an old product.
You need one pair per machine on which you want to upgrade the licensed component (agent).
As the old key, you can use a full or upgrade key for Acronis True Image 9.1/Echo, Acronis Backup & Recovery 10, or Acronis Backup & Recovery 11, regardless of the product installed on the machine.
- A full license key for Acronis Backup & Recovery 11.5. In this case, old license keys are not required.
You need one license key per machine on which you want to upgrade the licensed component (agent).

Back up a machine

We recommend that you back up a machine before upgrading the software on it. This will allow you to roll back the machine to a previous state if the upgrade fails for any reason or if there are any issues after the upgrade.

Choose the right time for the upgrade

During the upgrade, Acronis services will be restarted and all Acronis tasks related to these services will be stopped. We recommend that you select the time for the upgrade when no backup plan or recovery task is running.

4 Upgrade procedure

The following procedure is the same when you upgrade from Acronis Backup & Recovery 10 and from Acronis Backup & Recovery 11.

4.1 Upgrading the license server, management server, console, and storage nodes

Upgrading the software

First, perform the following steps on the machine where the license server is installed. Then, repeat them on a machine (if any) where the management server, management console, or storage node is installed.

1. Run the Acronis Backup & Recovery 11.5 setup program.
2. Click **Install Acronis Backup & Recovery 11.5**.
3. Accept the terms of the license agreement, and then click **Next**.
4. Click **Update** or **Modify**.

Details. Click **Modify** if you need to add or remove the product components. Select the check boxes next to the components you want to add, and clear the check boxes next to the components you want to remove. The components whose check boxes you leave selected will be upgraded.

If you want to remotely upgrade agents on machines running Windows, add **Components for Remote Installation** when upgrading the management server.

5. If Agent for Windows is installed on the same machine, you will be prompted to specify the license. Do the following:
 - a. Make sure that the **License server** field contains the license server from which the agent license is taken. If not, click **Specify** or **Change**, specify the license server IP address or name, and then click **OK** to confirm.
 - b. If the **License for backup of disks/files** list contains the Acronis Backup & Recovery 11.5 edition that matches the edition installed on the machine, select it.
Otherwise, click **Add licenses** and add the upgrade license keys to the license server. If the old license keys are not present on the license server, add them as well.
6. Follow the on-screen instructions.
7. On successful upgrade, click **Finish** to close the wizard window.
8. If Acronis Startup Recovery Manager was activated on the machine, activate it again after the upgrade.

If several Acronis Backup & Recovery 10 or 11 components are installed on the machine, all of them are upgraded.

Adding license keys to the license server

If you have added the upgrade license keys to the license server during the upgrade procedure, skip this step. Otherwise, add the license keys to the license server now. Do the following:

1. Run the console by double-clicking the **Acronis Backup & Recovery 11.5** icon on the desktop.
2. On the **Tools** menu, click **Manage licenses**.
3. Specify the IP address or name of the license server and click **OK**. If prompted for credentials, specify the user name and password.
4. Either type the upgrade keys or import them from a file. If the old license keys are not present on the license server, add them as well.

4.2 Upgrading Agent for Windows and Agent for Linux

You can upgrade the agents either locally or remotely.

The remote upgrade is most effective when you have many machines with an identical set of Acronis Backup & Recovery 10 or 11 components installed.

To learn which agents are installed on a machine, connect the console to the management server, click **Machines with agents > All machines with agents**, right-click the required machine, and then click **View details**. To view whether Deduplication and/or Universal Restore is installed on the machine, right-click the required machine, and then click **Change license**.

4.2.1 Local upgrade of Agent for Windows

On each machine with an agent, do the following:

1. Run the Acronis Backup & Recovery 11.5 setup program.
2. Click **Install Acronis Backup & Recovery 11.5**.
3. Accept the terms of the license agreement, and then click **Next**.
4. Click **Update**.
5. Make sure that the **License server** field contains the license server from which the agent license is taken. If not, click **Specify** or **Change**, specify the license server IP address or name, and then click **OK** to confirm.
6. In the **License for backup of disks/files** list, select the Acronis Backup & Recovery 11.5 edition that matches the edition installed on the machine. Click **Next**.
7. Click **Update** to proceed with upgrade.
8. If Acronis Startup Recovery Manager was activated on the machine, activate it again after the upgrade.

4.2.2 Local upgrade of Agent for Linux

Downloading installation files

Before proceeding with the upgrade, you need to download the installation files and assign them necessary access permissions:

1. Go to the Acronis Web site.
2. Depending on the machine platform and your edition of Acronis Backup & Recovery 11.5, download the installation file or files (.i686 or .x86_64 files).
3. Copy the installation files to a directory on the machine where you want to install Acronis Backup & Recovery 11.5.
4. Go to the directory where you copied the installation files, and then run the following command:

```
chmod 755 ABR11*
```

Upgrade steps

On each machine with an agent, do the following:

1. Run the downloaded installation file as the root user.
2. In the welcome window, select **Next**.
3. Accept the terms of the license agreement.

4. Select **Next**, and then specify the license server.
5. Follow the on-screen instructions.
6. If Acronis Startup Recovery Manager was activated on the machine, activate it again after the upgrade.

4.2.3 Remote upgrade

4.2.3.1 Preparation

Preparation of machines running Windows

Before proceeding with remote upgrade, prepare the remote machines as follows:

- **Simple file sharing.** For successful upgrade on a remote machine running any Windows XP version, the option **Control panel > Folder options > View > Use simple file sharing** must be *disabled* on that machine.
- **User Account Control.** For successful upgrade on a remote machine running Windows Vista or later, User Account Control (UAC) must be set to **Never notify**. To access this option, go to **Control panel > View by: Small icons > User Accounts > Change User Account Control Settings**. This change requires a machine reboot.
- **File and Printer Sharing** must be *enabled* on a remote machine. To access this option:
 - On a machine running Windows XP with Service Pack 2 or Windows 2003 Server: go to **Control panel > Windows Firewall > Exceptions > File and Printer Sharing**.
 - On a machine running Windows Vista, Windows Server 2008, or Windows 7: go to **Control panel > Windows Firewall > Network and Sharing Center > Change advanced sharing settings**.
- **Ports.** Acronis Backup & Recovery 11.5 uses TCP ports 445 and 25001 for remote upgrade. Also, it uses TCP port 9876 for remote upgrade and for communication between the components. Port 445 is automatically opened when you enable File and Printer Sharing. Ports 9876 and 25001 are automatically opened through Windows Firewall. If you use a different firewall, make sure that these three ports are open (added to exceptions) for both incoming and outgoing requests.

After the remote upgrade is complete, you can remove ports 445 and 25001 from exceptions. Port 25001 is automatically closed through Windows Firewall. Port 9876 needs to remain open.

Preparation of machines running Linux

1. Make sure that TCP port 22 is opened and that the SSH daemon is running on each virtual machine you want to upgrade. After the remote upgrade is complete, you can close the port and stop the SSH daemon.
2. Open TCP port 9876 on each virtual machine you want to upgrade. Acronis Backup & Recovery 11.5 uses this port for communication between the components; therefore, it must remain open for both incoming and outgoing requests.
3. By default, the management server takes the installation packages from the folder `%CommonProgramFiles%\Acronis\RemoteInstaller\<product build number>`. To be able to remotely upgrade Agent for Linux, download the agent installation files (.i686 or .x86_64) from the Acronis Web site and put them into this folder on the management server.

4.2.3.2 Upgrade

1. Connect the console to the management server where you have installed the **Components for Remote Installation**.
2. On the **Tools** menu, click **Install Acronis components**.
3. Select the machines on which the components are to be upgraded. Specify each machine's name or IP address and the administrator's user name and password. You can also add machines by browsing the network, by browsing an Active Directory domain, by importing the list of the machines from a .txt or .csv file, or from RHEV environment. Click **Next**.
4. In the list of components, select all components that are installed on the machines. Be sure to select the agents' add-ons (Deduplication, Universal Restore) if they are installed. You can also add other Acronis Backup & Recovery 11.5 components or add-ons to install.
5. Specify the license server and provide access credentials for it.
6. Follow the on-screen instructions.
7. If Acronis Startup Recovery Manager was activated on the machines, activate it again after the upgrade.

4.3 Upgrading Agent for ESX(i)

Licenses

Make sure that you have licenses described in "Before the upgrade" (p. 6). You need licenses for all ESX(i) hosts you want to upgrade. Add these licenses to the license server before starting the upgrade.

Note for upgrade from Acronis Backup & Recovery 10.

After you upgrade a part of the existing agents, the new management server automatically distributes virtual machines among them. Since the old agents do not provide the information necessary for automatic distribution, they do not participate in it. As a result, all of the load will be concentrated on the new agents.

Agent for ESX(i) (Virtual Appliance)

You can upgrade only those agents that are registered on the management server. If some of the agents are not registered, register them before upgrading.

To upgrade the agents from the management server

1. Connect the console to the management server.
2. In the **Navigation** tree, right-click the group that has the same name as the vCenter Server. If VMware vCenter integration is not enabled, right-click **Virtual machines**.
3. Click **Update Agent for ESX(i)**.
4. Select the agents that you want to upgrade. Agents that are already of the latest version are unavailable for selection.
5. Click **Update Agent for ESX(i)**.

The agents will be upgraded; their configuration settings will be preserved.

Agent for ESX(i) (Windows)

Follow the upgrade procedure for Agent for Windows (p. 9). The only difference is that you do not need to specify license keys during upgrade.

4.4 Upgrading Agent for Hyper-V

Agent for Hyper-V enables you to back up and recover virtual machines from a Hyper-V host without installing agents on the virtual machines. To upgrade Agent for Hyper-V, you need one upgrade license per Hyper-V host.

- In Windows 2008/2008 R2, Agent for Hyper-V is upgraded along with Agent for Windows (p. 9).
- In Microsoft Hyper-V Server 2008/2008 R2, you can upgrade the agent remotely (p. 10).

Acronis Backup & Recovery 11.5 features Hyper-V cluster support. If you have a Hyper-V cluster (also called a failover cluster), we recommend that you install Agent for Hyper-V on each node of the cluster. This will enable you to back up a clustered virtual machine no matter what node it migrates to.

4.5 Upgrading the command-line utility

Acronis Backup & Recovery 11.5 supports the command-line interface with the `acrocmd` utility.

Upgrade from Acronis Backup & Recovery 10

Unlike the `trueimagecmd` utility used in Acronis Backup & Recovery 10 or earlier, `acrocmd` does not contain any tools that physically execute the commands. It merely provides the command-line interface to Acronis Backup & Recovery 11.5 components—agents, storage nodes and the management server. As with Management Console, you install the command-line utility on the machine from which you prefer to operate (run commands or scripts).

If you are not going to use old scripts, it is enough to install the utility on one machine (for example, where the console is installed). Other machines will be operated remotely.

How to continue using old scripts

To continue using your existing scripts, edit them so that `trueimagecmd` is replaced with `acrocmd`. If your scripts contain the path to the `trueimagecmd` utility, replace it with the path to the `acrocmd` utility. Retain all other parameters and values.

Installation procedure

The software installs the command-line utility on every machine where an agent is installed. No additional actions are needed.

Upgrade from Acronis Backup & Recovery 11

The `acrocmd` utility usually installs along with other Acronis Backup & Recovery 11 components. If you have upgraded these components, your command-line utility has also probably been upgraded. If there is a machine where only the utility is installed, run the setup program on this machine and upgrade the command-line utility in the same way as other components.

4.6 Upgrading bootable media

As a part of the upgrade process, you should create an Acronis Backup & Recovery 11.5 bootable media.

Bootable Media Builder usually installs along with an agent or a console. If you have upgraded the agents and the console, your media builder has also probably been upgraded. If there is a machine

where only the media builder is installed, run the setup program on this machine and upgrade the media builder in the same way as other components. Then, create bootable media using the upgraded media builder.

5 Tips for further usage

5.1 After upgrading from Acronis Backup & Recovery 10

5.1.1 Catalog old backups

Acronis Backup & Recovery 11.5 has a feature called data catalog. It allows you to easily find the required version of data and select it for recovery. Backups created by Acronis Backup & Recovery 11.5 are cataloged automatically.

You can include the backups created by Acronis Backup & Recovery 10 in the catalog. To do this, connect the console to the management server or to a new agent, go to the vault where the backups are located, click the **Data view** tab and click the **start cataloging now** or **update the catalog now** link. Please be aware that the cataloging procedure may be time- and resource-consuming.

5.1.2 Retire backward compatible managed vaults

After you have upgraded all the Acronis Backup & Recovery 10 agents, backward compatible managed vaults are no longer needed. You have two options to choose from:

- **Leave a backward compatible vault "as is" and continue backing up to it**
You will not be able to define **Vault administrators** and **Vault users** for the vault. Besides, if the vault is a deduplicating one, the old archives will not be deduplicated with the archives written by Acronis Backup & Recovery 11.5 agents. This decreases the deduplication ratio.
- **Create a new vault without the backward compatibility property**
You will have to edit the backup plans to redirect the backups to the new vault. The backups in the old vault remain available as long as you need them. Once their retention period expires, delete the backups and the vault.

If you want to move the old archives to the new vault, export them using the following command:

```
acrocmd export archive --service=asn --host=<storage node> --credentials=<storage node user name>,<password> --loc=<old vault> --target=<new vault> --credentials=<new vault user name>,<password> --target_arc=<new archive name>
```

Since the export is performed by Acronis Backup & Recovery 11.5, the old archives will be treated as if they were created by Acronis Backup & Recovery 11.5. If the target vault is a deduplicating one, the old archives will be deduplicated with the archives written by Acronis Backup & Recovery 11.5 agents.

After the export is completed, you need to catalog the new vault.

5.1.3 Use 64-bit Storage Node

Acronis Backup & Recovery 11.5 Storage Node has a 64-bit version. It provides better deduplication performance and can process more unique data. In a 64-bit system, the 64-bit version is installed automatically during the upgrade. No additional action is required.

If you are using deduplication on a 32-bit storage node, we highly recommend that you migrate to a 64-bit system. A 32-bit system can effectively process not more than 400 GB of unique data. Even if you are satisfied with the current deduplication performance, the appropriate hardware will provide a reserve in case you will need to back up more machines in the future.

For more information about requirements for the storage node, see the "Deduplication best practices" section of the product Help or User Guide.

5.2 After upgrading from Acronis Backup & Recovery 10 or 11

5.2.1 Use the management server Web page for installation

The management server Web page, available in Acronis Backup & Recovery 11.5, can be used for installation on multiple machines in a network that does not allow sharing folders. You can go to that Web page from any machine with a supported Web browser.

To start using the Web page, make sure that the **Components for Remote Installation** component is installed on the machine with the management server. If not, install these components. To activate the service, run the **Services** snap-in, change the logon parameters of Acronis Web Server Service to the account of any user belonging to the Acronis Centralized Admins group, and then start the service.

6 What else you may want to know

Will the default backup and recovery options be preserved after the upgrade?

Yes, with a few exceptions.

- Options of Acronis Backup & Recovery 10 that are not present in Acronis Backup & Recovery 11.5:
 - The **Overwrite data on a tape without prompting for user confirmation** and **Dismount media after backup has finished** backup options.
 - The **Save software RAID and LVM metadata along with backups** option. The metadata is always saved in Acronis Backup & Recovery 11.5 backups.
- Options of Acronis Backup & Recovery 11 that are not present in Acronis Backup & Recovery 11.5:
 - The **Use FTP in Active mode** backup and recovery option. To establish an active mode FTP connection, specify **ftp://ftp_server:port_number** when selecting the backup location.
 - The **After recovery, run the preconfigured Acronis Recovery for MS Exchange bare-metal recovery task (if available)** recovery option.
 - The **Eject tape - When the tape is full** backup option of Acronis Backup & Recovery 11 version earlier than Update 0.5 (build 17437).
 - The **Automatically catalog backup as soon as it is created** backup option of Acronis Backup & Recovery 11 version earlier than Update 0.5 (build 17437). Instead, you can select whether to perform full or fast cataloging.

Is it possible to upgrade to a different language version of the product?

If the language version of Acronis Backup & Recovery 10 or 11 does not match the language version of Acronis Backup & Recovery 11.5, you have to uninstall the old product and then install Acronis Backup & Recovery 11.5 anew. In this case, you can use the same license keys as described in "Before the upgrade" (p. 6).

Is it possible to upgrade from Acronis True Image Echo?

If you want to upgrade from Acronis True Image Echo to Acronis Backup & Recovery 11.5 and retain your tasks and settings, you need to upgrade to Acronis Backup & Recovery 10 first. For more details, see the "Upgrading to advanced editions of Acronis Backup & Recovery 10" document.

7 Upgrade from Acronis Recovery for Microsoft Exchange

Upgrading from Acronis Recovery for Microsoft Exchange to Acronis Backup & Recovery 11.5 means that you install Acronis Backup & Recovery 11.5 Agent for Microsoft Exchange Server (hereinafter referred to as Agent for Exchange) on a machine with Acronis Recovery for Microsoft Exchange.

As a result:

- Acronis Recovery for Microsoft Exchange **is automatically uninstalled** and Acronis Backup & Recovery 11.5 is installed.
- Tasks of Acronis Recovery for Microsoft Exchange **are deleted**.
- Backups created with Acronis Recovery for Microsoft Exchange **remain intact** and you can recover from them. For more information about the operations that Acronis Backup & Recovery 11.5 can perform with old archives and backups, see the "Supported operations with legacy archives and backups" section of the "Backing Up Microsoft Exchange Server Data" document.

Limitations

Acronis Backup & Recovery 11.5 does not support Microsoft Exchange 2000 Server and Windows 2000. So, you cannot perform the upgrade on this Exchange or Windows version.

License keys

When installing Agent for Exchange, you can specify the following pairs of license keys:

- Upgrade license key for Acronis Backup & Recovery 11.5 for Microsoft Exchange Server + full license key for Acronis Recovery for Microsoft Exchange.
- Upgrade license key for Acronis Backup & Recovery 11.5 Advanced Server SBS Edition + full license key for Acronis Recovery for Microsoft Exchange SBS.
- Upgrade license key for Acronis Backup & Recovery 11.5 Advanced Server SBS Edition + full or upgrade license key for Acronis Backup & Recovery 10 or 11 Advanced Server SBS Edition.

Installation with full license keys for Acronis Backup & Recovery 11.5 for Microsoft Exchange Server is also possible. In this case, old license keys are not required.

Installation procedure

If no other Acronis product is installed on the same machine

Install Agent for Exchange as described in the Installation Help available in the Acronis Backup & Recovery 11.5 setup program.

If Acronis Backup & Recovery 10 or 11 is installed on the same machine

1. Run the Acronis Backup & Recovery 11.5 setup program.
2. Click **Install Acronis Backup & Recovery 11.5**.
3. Accept the terms of the license agreement, and then click **Next**.
4. Click **Modify**, and then select **Agent for Microsoft Exchange** in the tree. Click **Next**.
5. You will be notified that Acronis Recovery for Microsoft Exchange components will be uninstalled. Click **Next**.
6. Select the licenses:
 - a. Make sure that the current license server is specified in the **License server** field. If not, click **Specify** or **Change**, specify the license server IP address or name, and then click **OK** to confirm.
 - b. Specify the license for backing up disks and files (if Agent for Windows is installed):
If the **License for backup of disks/files** list contains the necessary Acronis Backup & Recovery 11.5 edition, select it.
Otherwise, click **Add licenses** and add the upgrade license keys to the license server. If the old license keys are not present on the license server, add them as well.
 - c. Specify the license for backing up Microsoft Exchange Server data:
Click **Add licenses** and add the upgrade license keys to the license server. If the old license keys are not present on the license server, add them as well.
7. Follow the on-screen instructions.
8. On successful upgrade, click **Finish** to close the wizard window.
